

Implementation of AI Agents

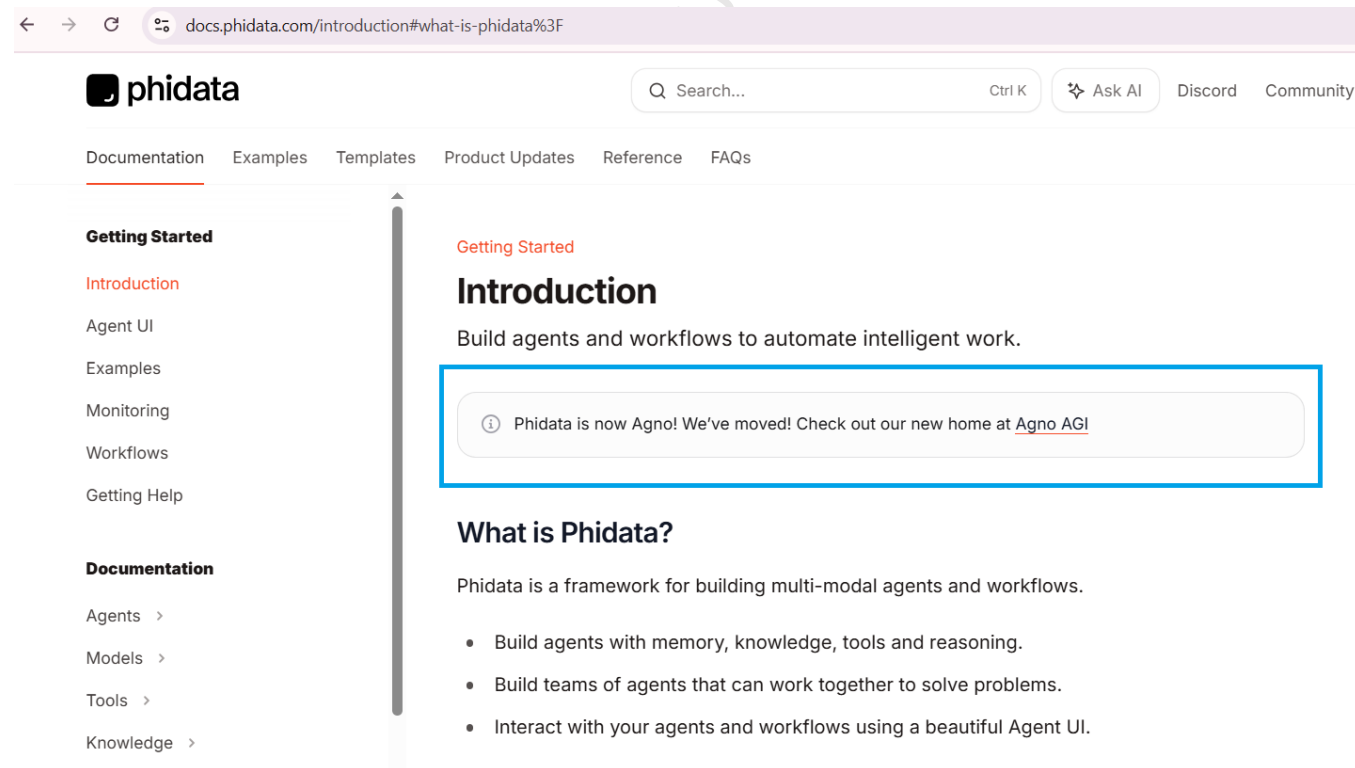

Agentic AI using Agno (phidata)

Website: <https://inttrvu.ai>

What is Agno (phidata)?

AGNO is an open-source agentic AI framework (formerly called **phidata**) that enables you to build **modular, tool-augmented AI agents** in Python.

The screenshot shows the phidata documentation website. The browser address bar displays `docs.phidata.com/introduction#what-is-phidata%3F`. The page header includes the phidata logo, a search bar, and links for "Ask AI", "Discord", and "Community". The navigation menu lists "Documentation", "Examples", "Templates", "Product Updates", "Reference", and "FAQs". The left sidebar under "Getting Started" lists "Introduction", "Agent UI", "Examples", "Monitoring", "Workflows", and "Getting Help". The "Introduction" page content includes the heading "Introduction" and the subheading "Build agents and workflows to automate intelligent work." A blue-bordered box highlights a message: "Phidata is now Agno! We've moved! Check out our new home at [Agno AGI](#)". Below this, the section "What is Phidata?" is followed by a definition and a bulleted list of features.

Introduction

Build agents and workflows to automate intelligent work.

📄 Phidata is now Agno! We've moved! Check out our new home at [Agno AGI](#)

What is Phidata?

Phidata is a framework for building multi-modal agents and workflows.

- Build agents with memory, knowledge, tools and reasoning.
- Build teams of agents that can work together to solve problems.
- Interact with your agents and workflows using a beautiful Agent UI.

Core Components of Agno

- Agent: A self-contained unit with a role, tools, and an LLM backend
- OpenAIChat, OllamaChat: LLM model integrations
- Built-in tools: DuckDuckGoTools, YFinanceTools, etc.
- @tool: Decorator to wrap any Python function as an agent tool
- Team: A container to coordinate multiple agents

Website: <https://inttrvu.ai>

Recap: Why Agno?

- Lightweight, Pythonic agent framework
- Can be easily integrated with top LLMs from OpenAI, Anthropic, Google, DeepSeek, etc.
- Wrap any function as a tool for an LLM-powered agent
- Easily create multi-agent workflows using Team
- Agno helps you go from **prompting to programming agents**: modular, reusable, and capable.
